Strategy Trading

Strategy trading is using a set of trading rules to systematically enter and exit the market, typically based on technical indicators. TradeStation can also employ strategies based on fundamental data for stocks.

Strategy testing in TradeStation is done in Chart Analysis windows. Strategies or groups of strategies may be inserted into charts for the purpose of testing historical performance, monitoring current activity and, eventually, automating real-time order entry and execution.

When a strategy or group of strategies is inserted into a Chart Analysis window, the entries and exits are shown as up and down arrows on the chart. The chart also identifies the names of the entries and exits, as well as the net open position at the close of any bar on which there would have been a trade. A dotted line connects entries and exits to display the profitability of the trade.
Using Strategy Components

Dozens of strategy components, based on most of the standard technical indicators and many fundamental data fields, are supplied with TradeStation. This allows you to test many of the indicators you already use every day. In addition, there are exit strategies for stop loss, profit targets, trailing stops and many others. Together, these allow you to build and test complex strategies by combining different strategy components.

To access the TradeStation built-in strategies, click on the Insert – Strategy menu sequence. This will display the Insert Strategies dialog. You may also right-click on the background of a Chart Analysis window and click on Insert Strategy... from the right-click menu to access the same dialog.

In the Strategy Components tab, strategies are listed in alphabetical order and a checkmark is displayed under Buy, Sell, Short, or Cover, based on the order action that it generates.

To view a synopsis of the strategy and information on how to format it, select the strategy and click on the Definition button. This will open TradeStation Help directly on the topic describing the strategy.

All supplied strategies are written in EasyLanguage and the formulas may be viewed, copied or modified. From the Insert Strategies dialog, select the strategy and click on the Edit EasyLanguage... button. This will open the TradeStation Development Environment and the EasyLanguage document for that specific strategy.

Click on the Import button if you wish to import a strategy from the TradeStation TradingApp Store or from a third-party EasyLanguage File Document (ELD). If you have strategies imported from the TradeStation TradingApp Store, you may find these products by selecting the TradingApp Store Subscriptions tab at the top of the dialog.

Note: In a Chart Analysis window containing multiple symbols, strategies are always applied to the first symbol that was plotted in the Chart Analysis window, known as Data1. The strategy can reference other symbols on the chart, but orders will be generated only for Data1.
**Formatting Strategies**

To format strategies, click on the **Format – Strategies...** menu sequence and the **Format Analysis Techniques & Strategies** dialog will appear displaying all strategies. The parameters used in the calculation of the strategy are listed in the **Input Values** column. Also, the columns **Buy, Sell, Sell Short** and **Buy to Cover** display the order action that the strategy generates. You may click on the dropdown to change the specific order action or turn it off.

The **Status** button on this dialog allows you to turn off any strategy component that you wish to disable without removing it from the Chart Analysis window; clicking **Status** a second time will enable it. The **Remove** button will remove the highlighted strategy from the list.

![Format Analysis Techniques & Strategies dialog](image)

Each strategy applied to a Chart Analysis window has its own **Format Strategy** dialog, containing an **Inputs** tab. This allows you to test each strategy with different input values. On the **Format Analysis Techniques & Strategies** dialog, select the strategy you wish to format and click on the **Format...** button.

![Format Strategy dialog](image)

In the **Format Strategy** dialog, click on the **Inputs** tab to make changes to the inputs of that specific strategy.

Click on the **Entries** and **Exits** tabs to format the color and style of strategy signals and labels.
By default, strategies are calculated at the close of the bar and orders are generated and remain active for the duration of the following bar.

Click the Calculation tab and select **Intrabar order generation and calculation** to change the default calculation of the strategy. With intrabar order generation enabled, the strategy engine can evaluate conditions and criteria every tick during a bar and can generate orders as soon as the conditions or criteria are met. Select the calculation method that best fits your trading strategy.

Click on OK, and then select another strategy from the **Format Analysis Techniques and Strategies** dialog if you wish to format any of its settings.

**Setting Strategy Properties**

From the **Format Analysis Techniques & Strategies** dialog, click on the Properties for All… button.

The **General** tab allows you to set such properties as commission and slippage amounts to be used in your back-testing. You may also set the initial capital and interest rate to be used in the Strategy Performance Report, increase the back-test resolution, enable pyramiding and adjust the trade size.

Some assumptions are made when filling orders using historical data. The **Backtesting** tab allows you to modify the behavior of these historical strategy-filled orders.

When automating a strategy, your strategy orders and positions may not always match your real trading account. The **Automation** tab provides settings to allow your strategy orders and positions to be synchronized with your real account orders and positions.
Commission and Position Slippage amounts can be entered per Trade or per Share/Contract. Initial Capital and Interest Rate are values that are used to calculate performance measures in the Strategy Performance Report.

By default, when analyzing historical data in a chart to determine if a strategy would have generated a signal, the strategy only uses the open, high, low and close prices of a bar. Generally, assumptions are made in regard to the direction of the price when the bar opens. To allow the strategy to calculate using more data points and avoid assumptions, check the "Use Look-Inside-Bar Back-testing" checkbox. Depending on the data interval of the chart, you may select Daily, Minute, Second or Tick to increase the back-testing resolution.

Strategies will only take one trade in one direction at a time. For example, if a strategy is in a long position it will not generate another long entry until it is flat or in a short position. You may check the "Allow up to '50' entry orders in the same direction as the currently held position:" checkbox to enable pyramiding. This way the strategy may trade again using the same or different entry order and increase your position size as the strategy criteria is met.

You may also adjust the strategy trade size by entering the quantity in the box next to Fixed Shares/Contracts or a dollar amount if using the Dollar(s) per trade option.
In a historical back-test, a strategy will always assume a perfect fill; market orders are filled immediately at the next available tick and limit orders are filled at the specified limit price. Under real market conditions, this may not always be the case.

To provide a more realistic order fill, you may set limit orders to fill only when the limit price has been exceeded, a specific number of shares have been traded or a specific number of trades have occurred.

You may also add slippage to market orders.
An automated strategy fills orders independently of what happens to the order in the real world. This may cause differences between actual fill prices and strategy fill prices. Also, a strategy may assume a fill while the order remains unfilled in the real world. To address these issues, select the appropriate radio buttons and checkboxes on this dialog to allow strategy orders to be filled based on feedback from the TradeStation trade server.

By default, stop orders are held and managed by the TradeStation platform running on your computer. When the stop price is reached, the strategy engine sends a market order. For stop orders to be managed and triggered by the TradeStation trade server, check the "Send strategy generated stop orders directly to the TradeStation Order Execution Network" checkbox.
Strategy Performance Report

The Strategy Performance Report provides a detailed view of how well a strategy might have performed for the period and on the data being tested.

It contains a series of tabbed pages that allow you to view detailed and summarized reports, graphs and analysis of all the trades that would have been generated by the strategy’s criteria.

It can also be accessed by clicking the Strategy Performance Report button from the toolbar. The Strategy Performance Report is only available when a strategy has been applied to a Chart Analysis window.
Back-Testing Using Portfolio Maestro

TradeStation’s Portfolio Maestro is a back-testing tool that lets you evaluate the performance of a group of strategies applied to a basket of symbols that make up your portfolio. The performance is based on the trades generated by the rules in your strategies along with other money management and ranking criteria that you specify. Portfolio Maestro also includes a range of reporting and analysis features to help you optimize your portfolio.

Portfolio Maestro is installed and runs separately from the TradeStation platform. Once installed, a Portfolio Maestro icon is displayed on your computer’s desktop.

The **Manage Strategy Groups** icon on the left shortcut bar allows you to group strategies and symbols together. Click on the **New** button at the top left to create a new Strategy Group and then click on the **Add Strategy** button in the **Strategies** tab to add strategies and the **Add Symbol List** button in the **Symbol Lists** tab to add symbols.

Click on the **Manage Portfolios** icon on the left shortcut bar and click on the **Add Strategy Group** button to add a group or groups of strategies and symbols lists. Once all strategies and symbols are included in the portfolio, click on the **Backtest Portfolio** button at the top right.

Click on the **Report** and **Analysis** tabs at the bottom of the shortcut bar to view performance reports and analysis graphs of the portfolio.
Strategy Optimization

Optimization is the process of testing a range of input values for the purpose of fine-tuning a trading strategy. TradeStation’s optimization feature allows you to test a range of values for any number of numeric inputs simultaneously. TradeStation will then generate a Strategy Optimization Report displaying results from these tests.

To optimize inputs in a strategy, go to the Format Strategy dialog for the specific strategy you wish to optimize, click on one of the numeric inputs, and then click on the Optimize... button. In the Optimize dialog, select the range of inputs to test and the increment to be used in stepping through the range of input values.

Once the optimization is complete, you may view an Optimization Report by clicking on the View – Strategy Optimization Report menu sequence. This option is only available after running an optimization.
Walk-Forward Optimizer

TradeStation’s Walk-Forward Optimizer divides the historical data in a Chart Analysis window to be tested as separate runs. Each run is further divided into two parts, an in-sample and an out-of-sample data segment. Strategy parameters are optimized using the in-sample data segment, and the optimal parameters selected are applied to the out-of-sample data segment. The strategy performance results from the out-of-sample data segments are compiled in a report, and these metrics determine the usability of the strategy.

Each run is subjected to Test Criteria and is given a pass or fail score based on the specified thresholds.

To run a walk-forward optimization, select Walk-Forward under Optimization Details before clicking on the Optimize button to optimize a strategy and enter a name in the Walk-Forward Test Name field. Once the optimization is complete, click on the Walk-Forward Optimizer button in the TradingApps Launcher. In the Walk-Forward Optimizer, click on the File – Open Walk-Forward Test menu sequence, select a Walk-Forward test and click on Open. Then click on the Walk-Forward Analysis – Start Cluster Analysis (Multiple WFA’s) menu sequence.

Information is organized in different tabs showing you optimization summaries for in-sample segments, walk-forward summaries for out-of-sample segments, the test results used in qualifying the different runs and a series of different graphs such as P/L history, sensitivity and distribution analysis.
Strategy Automation

A strategy is considered automated when you apply the strategy, or group of strategies, to a live Chart Analysis window and enable at least the first automation checkbox. As new data is collected, the corresponding strategy orders are automatically generated.

To automate the execution of your strategy orders, click on the Format – Strategies… menu sequence. At bottom of the Format Analysis Techniques & Strategies dialog, you will find the automation checkboxes.

TradeStation has two “levels” of strategy automation:

- **Generate strategy orders for display in TradeManager’s Strategy Orders tab.**
  This checkbox, used alone, will track hypothetical positions and create a real-time log of orders in the TradeManager window, but will not send orders to the market for execution.

- **Automate execution using 1234567 account with confirmation On/Off**
  This checkbox authorizes orders to be sent to the market for execution in the account you designate. Confirmation On requires that you authorize each order before it is placed.
IMPORTANT INFORMATION:

No offer or solicitation to buy or sell securities, securities derivative, futures products or off-exchange foreign currency (forex) transactions of any kind, or any type of trading or investment advice, recommendation or strategy, is made, given or in any manner endorsed by any TradeStation affiliate and the information made available on this Website is not an offer or solicitation of any kind in any jurisdiction where any TradeStation affiliate is not authorized to do business, including but not limited to Japan.

Past performance, whether actual or indicated by historical tests of strategies, is no guarantee of future performance or success. There is a possibility that you may sustain a loss equal to or greater than your entire investment regardless of which asset class you trade (equities, options futures or forex); therefore, you should not invest or risk money that you cannot afford to lose. Options trading is not suitable for all investors. Your account application to trade options will be considered and approved or disapproved based on all relevant factors, including your trading experience. Please click here to view the document titled Characteristics and Risks of Standardized Options. Before trading any asset class, customers must read the relevant risk disclosure statements on our Other Information page. System access and trade placement and execution may be delayed or fail due to market volatility and volume, quote delays, system and software errors, Internet traffic, outages and other factors.
